

Some 2015 Measurements of Wide and Faint Double Stars Compared with Visual Observations

Wilfried R.A. Knapp

Vienna, Austria

wilfried.knapp@gmail.com

Abstract: A backlog of astrometry and photometry measurements made in 2015 for comparison with visual observations is reported here with the intention of providing recent precise measurements for the given objects

Report

Visual observations often pose questions when comparing the impressions with the parameters listed in the Washington Double Star catalog and often questions arise during session planning. To countercheck such impressions, I made measurements based on images made with a remote telescope. In most cases the

measurement results confirmed the need for updating the current WDS catalog data, but in some cases the data made evident that visual impressions can sometimes be very misleading.

The WDS catalog data from the end of 2015 for the studied objects is listed in Table 1.

The measurement results are given in Table 2 with the Notes column providing additional information

Table 1: WDS catalog values for the selected objects intended for comparison with visual observation

WDS ID	Name		RA	Dec	Sep	M1	M2	PA	Con

Some 2015 Measurements of Wide and Faint Double Stars Compared with Visual Observations

about the used images and references to visual observation. In Table 2 RA and Dec are the coordinates based on plate solving with UCAC4 reference stars in the 10.5 to 14.5mag range. Sep is separation calculated as

$$Sep = \sqrt{[(RA_2 - RA_1)\cos(dec_1)]^2 + (dec_2 - dec_1)^2}$$

in radians. Err_Sep is calculated as

$$Err_Sep = \sqrt{dRA^2 + dDec^2}$$

with dRA and $dDec$ as average RA and Dec plate solving errors. PA is calculated as

$$PA = \arctan\left[\frac{(RA_2 - RA_1)\cos(Dec_1)}{Dec_2 - Dec_1}\right]$$

in radians depending on quadrant. Err_PA is the error estimation for PA calculated as

$$Err_PA = \arctan(Err_Sep / Sep)$$

in degrees assuming the worst case that Err_Sep points in the right angle to the direction of the separation means perpendicular to the separation vector.

Mag is the photometry result based on UCAC4 reference stars with Vmags between magnitudes 10.5 and 14.5. Results for stars significantly brighter than 10.5 mag are for this reason not reliable and therefore not listed. Err_Mag is calculated as

$$Err_Mag = \sqrt{dV_{mag}^2 + [2.5\log_{10}(1 + 1/SNR)]^2}$$

with dV_{mag} as the average Vmag error over all used reference stars and SNR is the signal to noise ratio for the given star.

Date is the Bessel epoch in 2015 and N is the number of images (usually with one second exposure time) used for the reported values. iT in the Notes column indicates the telescope used with number of images and exposure time given.

Telescope Magnitude Resolution Limit Determination

Additionally a few wide multiples (BU 298, BAR 1 and SMR 33) were used to determine the current telescope magnitude resolution limit for visual observation sessions. For this purpose images and measurements were made to simply provide reliable magnitudes.

The measurement results are given in Table 3 with the Notes column providing additional information about the used images and references to visual observation and current end of 2015 WDS catalog data. Column headings are the same as described above for the

Table 2 headings.

Specifications of the used iTelescope equipment are as follows:

iT24: 610mm CDK with 3962mm focal length. CCD: FLI-PL09000. Resolution 0.62 arcsec/pixel. V-filter. No transformation coefficients available. Located in Auberry, California. Elevation 1405m

Astrometry Quality Control:

A few of the listed objects were selected by random for the purpose of quality control by comparison with URAT1 coordinates (considered the currently most precise available even if preliminary) if available for both components with the results listed below in Table 4.

All checked astrometry results were within the given error range estimation confirmed by comparison with the URAT1 coordinates. Comparison of measured magnitudes with URAT Vmags were only possible for a smaller number of objects with several results outside the given error range estimation but only by a very small margin.

Some 2015 Measurements of Wide and Faint Double Stars Compared with Visual Observations

Notes to Table 2.

1. iT24 stack 5x3s. SNR B<20. Visual observation suggested B far fainter than 12.1mag, confirmed
2. iT24 1x3s. Touching to overlapping star disks. Visual observation suggested A and B a tad brighter than listed, confirmed
3. iT24 stack 5x3s. Visual observation suggested B somewhat fainter, not confirmed by this measurement
4. iT24 stack 5x3s. Visual observation suggested B brighter than listed, confirmed
5. iT24 stack 5x3s. Visual observation suggested C brighter than listed, confirmed
6. iT24 1x3s. SNR for B<20. Visual observation suggested B far fainter than 10mag (old WDS August 2013 value in my session plan, meanwhile corrected to estimated 12). But Sep and PA also quite different
7. iT24 1x3s. Zero digit WDS mag for C suggested check
8. iT24 1x3s. SNR for B<20. WDS mags of 12/12.4 suggested check for good reason. No visual observation
9. iT24 1x3s. Visual observation suggested C far brighter than 12.3mag (old WDS August 2013 value in my session plan, meanwhile corrected to 11.56 confirmed by measurement)
10. iT24 1x3s. Visual observation suggested B far fainter than 9.9mag – not supported by this measurement but overlapping star disks might make B probably appear brighter than it really is
11. iT24 1x3s. Visual observation suggested B a bit brighter than 11.3, confirmed
12. iT24 1x3s. Visual observation suggested B fainter than 10.6 (WDS August 2013 value, meanwhile changed to 10.78), confirmed
13. iT24 1x3s. Visual observation suggested A and B far fainter than 9.4mag, confirmed
14. iT24 1x3s. Single digit WDS magnitude for B suggested check
15. iT24 1x3s. Touching star disks. Visual impression of B being reddish and fainter than currently listed and also than measured here
16. iT24 1x3s. SNR for B<20. Visual observation suggests B a bit fainter than 11.3mag, confirmed
17. iT24 stack 5x3s. Visual observation suggested B being fainter than 11.86mag – not really confirmed by this measurement, may be a tad
18. iT24 1x3s. SNR for B<20. Single digit WDS magnitude for B suggested a check
19. iT24 stack 5x3s. Visual observation suggested A much fainter than WDS 10.7mag. Confirmed by measurement
20. iT24 stack 5x3s. Visual impression A and B a tad brighter than WDS listed, confirmed
21. iT24 stack 5x3s. Heavily overlapping star disks - so this measurement is not very reliable. But the visual impression that this double is far fainter than WDS 9.2/9.7mag is certainly confirmed
22. iT24 1x3s. Visual observation suggested B being fainter than WDS 10.5 confirmed by measurement
23. iT24 1x3s. Visual observation suggested A and B being far fainter than WDS 9.2/9.6, confirmed
24. iT24 1x3s. Single digit WDS 11.9mag suggested check
25. iT24 1x3s. Visual observation suggested D being brighter than WDS 10.56mag, but this was not confirmed
26. iT24 1x3s. Part of STF 2225. WDS data confirmed
27. iT24 1x3s. Visual observation suggested B being fainter than WDS 11.1mag, confirmed

Some 2015 Measurements of Wide and Faint Double Stars Compared with Visual Observations

Some 2015 Measurements of Wide and Faint Double Stars Compared with Visual Observations

Notes to Table 3.

1. iT24 1x3s image taken for TML check. Sep and PA according to WDS values, Mag B about 0.3mag fainter than WDS listed
2. iT24 1x3s image taken for TML check. Part of BU298. Visual observation suggested C fainter than listed, not confirmed
3. iT24 1x3s image taken for TML check. Sep and PA according to WDS values, Mag D about 0.4mag brighter than listed
4. iT24 1x3s image taken for TML check. Sep and PA according to WDS values, Mag E about 0.9mag fainter than listed
5. iT24 1x3s image taken for TML check. Sep and PA according to WDS values, Mag F about 1.1mag fainter than listed
6. iT24 1x3s taken for TML check. SNR for C<20. C about 0.3mag fainter than listed
7. iT24 1x3s taken for TML check. WDS mag for D about confirmed
8. iT24 1x3s taken for TML check. WDS mag for E confirmed
9. iT24 1x3s taken for TML check. WDS mag for F confirmed
10. iT24 1x3s taken for TML check. G about 0.3mag fainter than listed
11. iT24 1x3s taken for TML check. C about 0.3mag fainter than listed
12. iT24 1x3s taken for TML check. WDS mag for I about confirmed
13. iT24 stack 5x3s taken for TML check. P about 0.5mag fainter than listed
14. iT24 stack 5x3s taken for TML check. Q about 1.4mag fainter than listed
15. iT24 stack 5x3s taken for TML check. R about 1.2mag fainter than listed
16. iT24 stack 5x3s taken for TML check. T about 0.3mag fainter than listed
